OM protein - protein search, using sw model

Run on: July 15, 2002, 13:47:11; Search time 10.15 Seconds (without alignments) 41.962 Million cell updates/sec

Title:
Perfect score:
Sequence: US-09-712-819A-8 58

Scoring table: 1 YGRKKRRQKKK 11

BLOSUM62 Gapop 10.0 , Gapext 0.5

Searched:

105224 seqs, 38719550 residues 410

Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0 Maximum DB seq length: 11

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Database :

SwissProt\_40:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

   The present sequence represents the HIV-1 tat protein which is used in an example of the present invention which describes a BH3 interacting domain death agonist (BHD) truncated protein. The BHD protein, the DNA encoding it or antisense sequences can be used for preventing or treating a decreased apoptotic state of a cell. The decreased apoptotic state that is treated results from a disease such as cancer, viral infections, lymphoproliferative conditions, arthritis, inflammation and autoimmune disease. Antibodies against the BHD protein can be used for detecting a BHD polypeptide in a cell or population of cell. The nucleic immunodeficiency disease (including AIDS), sensecence, neurodegenerative disease, ischaemic and reperfusion cell death, infertility and wound-healing. Primers derived from the nucleic acid encoding the BHD protest from the nucleic acid encoding the BHD primers derived from the nucleic acid encoding the BHD

   virus 8), yellow fever virus, flavivirus or rhinovirus, or suffering from or susceptible to plasmodial infection or a disease associated with a plasmodial infection, e.g. P. falciparum, P. vlvax, P. ovale, or P. malariae. The APS exhibits high transduction efficiency and specifically kills or injures cells infected by one or more pathogens. Pormation of the cytotoxin is minimized or eliminated in uninfected cells and in infected cells that keep the pathogen inactive. The APS can be specifically tailored to kill or injure cells infected by one or more pathogen attracts.
  a pathogen infection in a mammal. The method may further comprise administering a medicament e.g. AZT, ddI, ddC, d4T, 3TC, FTC, DAPD, 1592U89, CS92, acyclovir, ganciclovir, peniclovir or an interferon. The APS can also be administered to a mammal in the presence of a pathogen to induce apoptosis in a predetermined population of cells. The products can be used for treating mammals suffering from or susceptible to a viral infection or a disease associated with a virus, e.g. HIV, cytomegalovirus (CMV), herpes simplex virus, e.g. type 1 (HSV-1) hepatitis virus, type C (HCV). Kaposi's sarcoma-associated herpes virus (KSHV or human herpes (HCV).

  This sequence represents a Tat peptide.

The invention relates to a bcl homology domain 3 (BH3 domain), the derived from a proapoptotic member of the BCL-2 family. The BH3 polypeptide can be used in a method for promoting apoptosis in target cell, especially where the cell is a cancer cell a virus infectl or an autoantibody producing cell. The BH3 polypeptide can be in therapeutic compositions for treating disease including cancer, lymphoproliferative conditions, arthritis, inflammation, and autoin diseases, which may result from the down regulation of cell death
  cell
          beta-catenin are described. The modulating agent comprises an internalisation molety and one or more of an amino acid sequence SYLDS(PO.4)G, or a peptide analogue or peptideminetic of the amino acid sequence. The modulating agents are useful for the manufacture of a medicament for stimulating hair growth or reducing hair loss, stimulating skin exfoliation, and inhibiting the development of Alzheimer's disease. They may also be used to

A chimeric group or fusion peptide which comprises a portion of an anti-apoptotic polypeptide which inhibits apoptosis of lymphocytes in combination with a transport group is described. The transport group CC is capable of transporting the chimeric group or fusion peptide across the cell membrane. The anti-apoptotic polypeptide is FLICE-like CC inhibitor protein (FLIP) which inhibits feas and TNF mediated apoptosis by inhibiting binding of Caspase-8 to the Fas receptor complex, thus cc shutting off the downstream Fas signalling pathway. The chimeric group and fusion peptide are useful for inhibiting ligand-induced apoptosis by bringing them into contact with T cells. The chimeric group is useful for expanding T cells in vitro e.g. T cells specific for particular antigens such as tumour-specific antigen, for enhancing immune response and to inhibit the apoptosis of chronically activated T cells e.g. activated CD4^+ T cells in HTV infected pattents. The

expression of genes involved in cellular differentiation, the transcription of which is under the control of beta-catenin. The peptides given in ARB27035-BB2708B, ARB27284-B27300 and ARB27331-B27351 can be used as modulating agents which interrupt the interaction between alpha and beta catenin, causing increased levels of the latter and stimulating the activation of beta-catenin mediated transcription. This can be used to stimulate cell differentiation, which can then be used to promote hair growth and skin exfoliation. This latter is particularly useful in the improvement of photodamaged skin and to minimise wrinkles. The modulating peptide can also be used to reduce hearing loss resulting from inner ear disorders such as hyperacusis and tinnitus.

The present invention

sent invention is concerned with methods of modulating the beta-catenin in the cell, and methods of stimulating the

scrapie (or related spongiform encephalopathies), dyslexia, age-related memory loss or Lou Gehring's disease. Fusion molecules can also be used to kill virally infected cells, especially those infected with HIV. The vaccines are used to treat or prevent bacterial or viral infections. The methods are a highly effective means for transducing a molecule into an entire mammal or into specific cells, tissues, organs and systems within it. They also overcome bioavailability problems that are associated with many therapeutic agents (e.g., large molecular size, hydrophobicity, hydrophilicity, biological resistance), by providing efficient transduction of the target cell. The present sequence represents a protein transduction domain used in the invention.

  The present sequence is the tat protein transduction domain fron HIV, which can be used as a targeting signal. It can be used to internalise sequences, such as WUC-1 antagonists, within the cell. MUC-1 is a immunosuppressor, and antagonists act to reduce overactive immune responses. Thus, the peptide can be used to treat inflammatory disorders such as rheumatoid arthritis, poriasis, allergic contact dermatitis and ankylosing spondylitis, autoimmune disorders including myasthenia gravis, systemic lupus erythematosus, polyarteritis nodosa, Goodpastures syndrome, isopathic thrombocytopenic purpura, autoimmune haemolytic annemia, craves' disease, rheumatic fever, pernicious anaemia, insulin-resistant diabetes mellitus, bullous pemphigold, pemphigus vulgaris, viral myocarditis, autoimmune thyroiditis, male infertility, sarcoidosis, allergic encephalomyelitis, multiple sclerosis, Sjorgens disease petaria disease college and anomalia, craves' disease college and anomalis, sold and anomalia, craves' disease, rheumatic fever, pernicious anaemia, insulin-resistant diabetes mellitus, bullous pemphigold, pemphigus vulgaris, viral myocarditis, autoimmune thyroiditis, male infertility, sarcoidosis, allergic encephalomyelitis, multiple sclerosis, Sjorgens

   AAY93542-51 represent synthetic protein transduction domains, which are used in the protein transduction system of the invention. The specification describes a protein transduction system, which comprises a fusion protein. This fusion protein has a covalently linked protein transduction domain and cytotoxic domain. The system is useful for treating pathogen infection in mammals, infections such as those caused by CMV, HSV-1, HCV, KSHV, yellow fever virus, flavivirus or rhinovirus, retroviral infections such as HIV-1, HIV-2, HTVL-3 and/or LAV, plasmodial infections associated with P.faciparum, P.vivax, P.vovale, P.malariae. It is also useful for treating cancer, especially

  small peptide complexes and recombinant proteins, that induces the phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ ATPBASE (SERCA2a) within cardiomyocytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present sequence is the amino terminal, 11-amino acid protein transduction domain of the denatured human immunodeficiency virus (HTV) TAT protein. It belongs to the penetratin class of peptides, with translocating properties having the ability to carry hydrophilic compounds across the plasma membrane. It is used in the construction of

  The present invention relates to new isolated fibroblast growth factor like (FGF-L) nucleic acid molecules and polypeptides. The factor like (FGF-L) nucleic acid molecules and polypeptides. The seff-L polypeptide is useful for determining whether a compound inhibits FGF-L polypeptide. The FGF-L polypeptides of the invention are useful for treating. Preventing or ameliorating and fitting or an FGF-L polypeptide related disease, condition or disorder such as wound healing disorders, ulcers, gut disorders, liver disorders such as hepatitis and disbetes. The invention is also useful for diagnosing a pathological condition or susceptibility to a pathological condition in a subject and is useful for modulating levels of FGF-L in an animal.
   Other uses are detecting or quantifying the amount of FGF-L polypeptide and for identifying or developing nowel agonists and antagonists of the FGF-L polypeptide signalling pathway which are useful for treating one or more diseases or disorders, and also as an immunogen for producing antibodies for in vivo imaging. The present sequence represents an Il amino acid sequence from the human immunodeficiency virus (HIV) tat protein that is termed the protein transduction domain or TAT PDT.

   CC osteogenesis imperfecta, Paget's disease, periodontal disease, Controlled and Academia, acute glomerulonephritis, chronic glomerulonephritis, cancer, diabetes, obesity and cachexia. (I) is also useful for cancer, diabetes, obesity and cachexia. (I) is also useful for CC (I) with a compound which binds to FGFR-L polypeptide, by contacting CC (I) with a compound, determining the extent of binding of the FGFR-L polypeptide when bound to the compound. (II) is useful for modulating CC levels of a polypeptide in an animal. A transgenic animal comprising (I) CC levels of a polypeptide in an animal. A transgenic animal comprising (I) CC is useful for determining whether a compound inhibits FGFR-L polypeptide cactivity or FGFR-L polypeptide production, by exposing the transgenic animal to the compound and measuring FGFR-L polypeptide or production in CC animal to the compound and measuring FGFR-L polypeptide or production in CC the mammal. (II) is useful for mapping the locations of FGFR-L gene and CC related genes on chromosomes, as hybridisation probes in diagnostic assays to test for the presence of an FGFR-L nucleic acid molecule in mammalian tissue or bodily fluid samples, in gene therapy, and as tools CC for isolating corresponding FGFR-L polypeptide genes. (I) is useful as CC immunogen, and for cloning FGFR-L polypeptide lagnoss using an expression cloning strategy. The present sequence represents the anino acid sequence of human immunodeficiency virus (HIV-1) tat protein contents of the production of human immunodeficiency virus (HIV-1) tat protein contents of the production of the protein the invention.

   The invention relates to human CD20/immunoglobulin E (IgE)-receptor like polypeptides designated as agp-96614-al and agp-69406-al and nucleic acid molecules encoding such polypeptides. Polypeptides of the invention are useful for treating, preventing or ameliorating and adsease, condition, or disorder which includes cancer such as brain cancer; ovarian cancer; abnormal cell proliferation such as a carterioscelerosis, vascular restenosis; pathology from allargens such as allergies, asthma, dermatitis; dysfunction of immune system such as rheumatoid arthritis, autoimmune disease, multiple sclerosis, diabetes, transplant rejection and reproductive diseases such as infertility, preterm labour and delivery, endometriosis etc. They are also useful for identifying antagonists and as immunogens, for diagnose a number of diseases and disorders. Polypucleotides of the invention are used to map the location of CD20/IgE-receptor like gene and related genes on chromosomes and as hybridisation probes. They are also useful in gene therapy. The present sequence is protein that my tell in the protein of the content of the content of the location of CD20/IgE-receptor like invention are also useful in gene therapy.    diagnosis and prognosis of RA in a subject or for monitoring the effect CC of an anti-RA drug or therapy administered to a subject. The method CC comprises: (a) analysing a sample of serum or plasma and optionally CC synovial fluid by two-dimensional electrophoresis, to generate a two-CC dimensional array of features; (b) identifying at least one chosen CC feature whose relative abundance correlates with the presence or absence CC of RA; and (c) comparing the abundance of each chosen feature in the CC sample with the abundance of that chosen feature in serum or plasma from CC one or more persons without RA, where the relative abundance of the CC chosen feature or features in the sample indicates the presence or absence of RA in the subject. The method can also be used in clinical CC studies for testing drugs for therapy of RA, for purification of RA-CC diagnostic protein isoforms (RPIs), and for production of antibodies to CC compounds that promote or inhibit their activity, which are then used as CC RA drugs. Nucleic acid encoding RADFs can be used in gene therapy CC convenies that promote or inhibit their activity, which are then used as CC Protocols. AAY41844 to AAY42101 represent RPI peptides, AAY42101 to

28-NOV-2000;
  The sequence represents a schizophrenia-associated protein isoform (SPI). These protein isoforms, e.g. SPI-206, SPI-238 and SPI-240 are detectable in cerebrospinal fluid, serum or plasma and are useful markers of schizophrenia. The sequences can be used for treatment and diagnosis of schizophrenia, screening, prognosis, monitoring the results of therapy, identifying patients most likely to respond to a particular therapy and identification of new targets for drug treatment. SPI DNA is useful as a nucleic acid probe to detect the presence of nucleic acids or SPIs.

   targets to identify and produce potential therapeutic agents for the treatment of SCH. The paucity of detectable neuralgic defects distinguishes neuropsychiatric disorders such as SCH from neurological disorders, where manifestations of anatomical and blochemical changes have been identified in many cases. Consequently the identification and characterisation of cellular and/or molecular causative defects and
  neuropathies are necessary for improved treatment of neuropsychiatric disorders. AAU15114-AAU15762 represent the amino acid sequences of schizophrenia-associated isoforms used in the method of the invention
   cellular uptake region of the transactivating protein, TAT of HIV. These peptides are based on the region comprising amino acids 46-63 (see AAR86625) of the HIV TAT protein. These peptides are used to protect against infection by HIV. They may also be used to reduce viragenia in already infected patients. These immungens may be used viragenia in already infected patients.

   inherently capable of entering a target cell. The tat basic region amino acid sequence carries cargo molecules by covalent attachment. The reduced size of the transport peptides minimises interference with the biological activity of the cargo molecule. By virtue of the absence of the cysteine-rich region (residues 22-36) of the tat protein, problems of spurious transactivation and disulphide aggregation are solved. The reduced transport peptide size also enhances uptake efficiency.
   The sequences given in AAR49574-77 are fragments of the HIV tat protein which were used as transport moleties in the conjugate of the invention. These conjugates are used as cargo molecules for the efficient cytoplasmic and nuclear delivery of biologically active mon-tat proteins, nucleic acids and other molecules which are not

                      Ş
  This sequence represents the transport polypeptide Tat47-58GGC which can CC be used in a novel method for the delivery of biologically active cargo molecules into the cytoplasm and nuclei of eukaryotic cells. The tat crown constructed from the present extracellularly. This polypeptide taken up into cells when present extracellularly. This polypeptide CC has been constructed from the HIV-1 tat protein (see AAW31202) by CC removing the cysteine-rich region and the carboxy-terminal domain while retaining the basic region. Cargo molecules could be covalently linked to the protein to form a fusion protein without the existing problems of Spurious trans-activation and disulphide aggregation. The reduced size of transport polypeptides also minimises interference with the biological activity of the cargo molecule. This is applicable for therapeutic, prophylactic or diagnostic intracellular delivery of small collecules and macromolecules e.g. proteins, nucleic acids and covalently to the cargo molecule.

KW Pro
   A novel covalently linked chemical conjugate, comprises a transport polypeptide molety consisting of at least residues 49-57 of human immunodeficiency virus (HIV) tat protein, but not residues 22-36 and 73-86, e.g. the present peptide, and a cargo molety comprising a single or double stranded nucleic acid. The conjugate can be used to deliver cargo moleties into the cytoplasm and nuclei of cells for therapeutic, prophylactic and diagnostic applications. The HIV tat protein is readily taken up into cells and the cell nucleus. The reduced size of the transport polypeptides minimises interference with the biological activity of the cargo molecule. In addition, by virtue of the absence of the cystelne rich region of the HIV tat protein, the transport polypeptides solve the potential problems of spurious transactivation and disulphide

  protein (see also AAW26443), plus a Gly-Gly-Cys C-terminal extension. Novel transport proteins comprise modified HIV tat covalently attached to a cargo molecule (see AAW26436-42). The modified tat protein (see AAW26444-49) is characterised by the presence of the tat basic region (amino acids 47-59), and the absence of the Cys-rich region (amino acids 22-36) and the exon 2-encoded C-terminal region (amino acids 73-86). These modifications solve the potential problems of spurious trans-activation and disulphide aggregation, while the reduced size of the transport protein minimises interference with the biological activity of the cargo molecule. DNA molecules that encode the modified tat fusion proteins are claimed and can be used to deliver polypeptides or nucleic acids to the cytoplasm or nuclei of cells in vivo or in vitro.

   CC TAT protein fragment, tat47-SBGC which is used in a method for the coulei of cells, for therapeutic, prophylactic or diagnostic purposes. This is accomplished by the presence of a small, basic section of tat cransport protein of HIV. This is used as it is this protein which is conserved to cause human cells in culture to take up HIV. The method converses the use of a cargo moiety in combination with a transport conserved to susually in the form of a fusion protein. The cargo moiety is a chuman papillomavirus E2 repressor that retains its biological activity cafter delivery into a target cell and where the transport moiety is a come of following HIV tat protein fragments (a) as 47-58, (b) as 47-72, (c) 38-72, (d) as 38-58, (e) as 37-58, (f) as 1-21 and 38-72. (g) as 47-62 or as 38-62. The proteins allow delivery of specific competides into cells at high concentrations due to use of existing curansporters. Previous methods of delivery include bombardment and curansporters, which only allow a fraction of the cell population to be confected and can additionally damage cells as they cause physical opening confected and can additionally damage cells as they cause physical opening confected and can additionally damage cells as they cause physical opening confected and can additionally damage cells as they cause physical opening confected and can additionally damage cells as they cause physical opening confected and can additionally damage cells as they cause physical opening confected and can additionally damage cells as they cause physical opening confected and can additionally damage cells as they cause physical opening confected and can additionally damage cells as they cause physical opening confected and can additionally damage cells as they cause physical opening confected and can additionally damage cells as they cause physical opening confected and can additionally damage cells as they cause physical opening confected and can additionally can can be call part to the call part to the call can be call to the

  This peptide can be used as a universal transfer vector (UTV) and/or spacer sequence in novel chimeric adenovirus coat proteins (CPS). The peptide is encoded by a gene fragment (see AAT70272) of transfer plasmid pBSS 75-100 pGS(tat). Claimed UTVs/spacers are given in AAW19810-11, AAW19813-25, AAW19872, AAW19829, AAW19831-32 and AAW19834-43). Claimed CPS, such as fibre proteins, differ from wild-type CPs by the introduction of the UTV and/or spacer at or near the C-terminus. This imparts on the chimeric CP the ability to bind to and enter cells by means of a novel cell surface binding site. Adenoviral vectors comprising the chimeric CP are able to enter cells more efficiently than vectors comprising wild-type CP, especially at lower m.o.i. They are especially useful for gene therapy of e.g. cancers, genetic disorders, pathogenic infections, heart disease or autoimmune diseases.

   The invention relates to peptides comprising membrane transiting peptides with antiviral properties. The peptides are useful for treating or preventing a virus infection in a warm blooded animal, e.g., enveloped viruses such as human immunodeficiency virus (HIV), herpes simplex virus (HSV), cytomegalovirus (CMV) and non-enveloped virus. Preferably, the peptides are useful for treating or preventing infections from one or more HSVs. The antiviral peptides are used for treating viral infections of the skin or part of the oral or genital cavity. The present sequence is membrane transiting antiviral peptide.

   The sequences given in AAR49574-77 are fragments of the HIV tat prot which were used as transport moietles in the conjugate of the invention. These conjugates are used as cargo molecules for the efficient cytoplasmic and nuclear delivery of biologically active non-tat proteins, nucleic acids and other molecules which are not inherently capable of entering a target cell. The tat basic region manino acid sequence carries cargo molecules by covalent attachment. The reduced size of the transport peptides minimises interference with the blological activity of the cargo molecule. By virtue of the absence of the cysteine-rich region (residues 22-36) of the tat protein, problems of spurious transactivation and disulphide aggregation are solved. The reduced transport peptide size also enhances uptake efficiency.

  removing the cysteine-rich region and the carboxy-terminal domain while retaining the basic region. Cargo molecules could be covalently linked to the protein to form a fusion protein without the existing problems of spurious trans-activation and disulphide aggregation. The reduced size of transport polypeptides also minimises interference with the biological activity of the cargo molecule. This is applicable for therapeutic, prophylactic or diagnostic intracellular delivery of small molecules and macromolecules e.g. proteins, nucleic acids and

  19-JAN-1998 (first entry)
   AAW32914 standard; peptide;
   This sequence represents the transport polypeptide Tat38-58GGC which can be used in a novel method for the delivery of biologically active cargo molecules into the cytoplasm and nuclei of eukaryotic cells. The tat protein from immunodeficiency virus (e.g. HIV-1, HIV-2, SIV) is readily taken up into cells when present extracellularly. This polypeptide has been constructed from the HIV-1 tat protein (see AAW31202) by
   Fusion proteins containing truncated HIV tat sequences - useful for intracellular delivery of viral repressor proteins

  Ş
   A novel covalently linked chemical conjugate, comprises a transport polypeptide molety consisting of at least residues 49-57 of human immunodeficiency virus (HIV) tat protein, but not residues 22-36 and 73-86, e.g. the present peptide, and a cargo molety comprising a single or double stranded nucleic acid. The conjugate can be used to deliver cargo moleties into the cytoplasm and nuclei of cells for therapeutic, prophylactic and diagnostic applications. The HIV tat protein is readily taken up into cells and the cell nucleus. The reduced size of the transport polypeptides minimises interference with the biological activity of the cargo molecule. In addition, by virtue of the absence of the cysteine rich region of the HIV tat protein, the transport polypeptides solve the potential problems of spurious transactivation and disulphide

  Sequence 26, Application PC/TUS9102942 GENERAL INFORMATION:
  GENERAL INFORMATION:
  INFORMATION FOR SEQ ID NO:
SEQUENCE CHARACTERISTICS:
LENGTH: 25 amino acids
TYPE: AMINO ACID
   APPLICATION NUMBER: PO
FILING DATE: 19910429
CLASSIFICATION: 435
PRIOR APPLICATION DATA:
         TITUE OF INVENTION: ANTICOAGULANT AGENTS USEFUL IN TREATMENT TITLE OF INVENTION: OF THROMBOSIS
NUMBER OF SEQUENCES: 111
  APPLICANT: Sylvest
  APPLICANT:
   APPLICANT:
   APPLICANT:

The peptides are useful for regenerating cells, such as muscle cells, and in aiding cleatrisation, as well as in the treatment of immunosuppressive diseases. The peptides amplify the replication of human immunodeficiency virus (HIV) in vitro, and are useful in the detection of HIV infections. When used with anti-viral agents, they render the HIV more accessible to the antiviral agent,
                                                                                                                                                                                                                                          WPI;
                                         The sequences given in AAR86601-19 are immunogens derived from the cellular uptake region of the transactivating protein, TAT of HIV. These peptides are based on the region comprising amino acids 46-63 (see AAR86625) of the HIV TAT protein. These peptides are used to protect against infection by HIV. They may also be used to reduce viraemia in already infected patients. These immunogens may be used

                                                                                                                               The sequences given in AAR49574-77 are fragments of the HIV tat protein which were used as transport moleties in the conjugate of the invention. These conjugates are used as cargo molecules for the efficient cytoplasmic and nuclear delivery of biologically active non-tat proteins, nucleic acids and other molecules which are not inherently capable of entering a target cell. The tat basic region amino acid sequence carries cargo molecules by covalent attachment. The reduced size of the transport peptides minimises interference with the biological activity of the cargo molecule. By virtue of the absence of the cysteine-rich region (residues 22-36) of the tat protein, problems of spurious transactivation and disulphide aggregation are solved. The reduced transport peptide size also enhances uptake efficiency.
                                                                                                                                                                                                                                                                                                                                            Transport of cargo moieties into chemical conjugates comprising a

                                                                                                             This sequence represents the transport polypeptide Tat47-58GGC which can be used in a novel method for the delivery of biologically active cargo molecules into the cytoplasm and nuclei of eukaryotic cells. The tat protein from immunodeficiency virus (e.g. HIV-1, HIV-2, SIV) is readily taken up into cells when present extracellularly. This polypeptide has been constructed from the HIV-1 tat protein (see AAW31202) by removing the cysteine-rich region and the carboxy-terminal domain while retaining the basic region. Cargo molecules could be covalently linked to the protein to form a fusion protein without the existing problems of spurious trans-activation and disulphide aggregation. The reduced size of transport polypeptides also minimises interference with the biological activity of the cargo molecule. This is applicable for therefore the prophylactic or diagnostic intracellular delivery of small coulds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       07-OCT-1997

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      QΥ
                                                                          A novel covalently linked chemical conjugate, comprises a transport polypeptide molety consisting of at least residues 49-57 of human immunodeficiency virus (HIV) tat protein, but not residues 22-36 and 73-86, e.g. the present peptide, and a cargo molety comprising a single or double stranded nucleic acid. The conjugate can be used to deliver cargo moleties into the cytoplasm and nuclei of cells for therapeutic, prophylactic and diagnostic applications. The HIV tat protein is readily taken up into cells and the cell nucleus. The reduced size of the transport polypeptides minimises interference with the biological activity of the cargo molecule. In addition, by virtue of the absence of the cysteine rich region of the HIV tat protein, the transport polypeptides solve the potential problems of spurious transport to hypoptides solve the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    nucleic acid; delivery; cytoplasm; cell nucleus; therapy prophylaxis; diagnosis; spurious transactivation; HIV-1; disulphide aggregation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Conjugate for intracellular delivery - having amino acids 49-57 of human immur and nucleic acid cargo molety
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (FRAN/)

                                                                                                                                                                                                                                                        This polypeptide comprises amino acids 47-58 of the HIV tat protein (see also AAW26443), plus a Gly-Gly-Cys C-terminal extension. Novel transport proteins comprise modified HIV tat covalently attached to a cargo molecule (see AAW26436-42). The modified tat protein (see AAW2644-49) is characterised by the presence of the tat basic region (amino acids 47-59), and the absence of the Cys-rich region (amino acids 22-36) and the exon 2-encoded C-terminal region (amino acids 23-36) and the exon 2-encoded C-terminal region (amino acids 73-86). These modifications solve the potential problems of spurious trans-activation and disulphide aggregation, while the reduced size of the transport protein minimises interference with the biological activity of the cargo molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New DNA constructs for transporting molecules to cells - fusion protein comprising a modified HIV tat protein and carboxy-terminal cargo molety
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (BARS/)

CC delivery of biologically active cargo molecules into the cytoplasm and CC nuclei of cells, for therapeutic, prophylactic or diagnostic purposes. This is accomplished by the presence of a small, basic section of tat CC transport protein of HIV. This is used as it is this protein which is CC observed to cause human cells in culture to take up HIV. The method CC involves the use of a cargo molety in combination with a transport CC molety usually in the form of a fusion protein. The cargo molety is a CI human papillomavirus E2 repressor that retains its biological activity CC after delivery into a target cell and where the transport molety is a CC one of following HIV tat protein fragments (a) as 47-58, (b) as 47-72, (c) as 38-58, (e) as 37-58, (f) as 1-21 and 38-72, (d) as 38-52. The proteins allow delivery of specific cc peptides into cells at high concentrations due to use of existing CC transporters. Previous methods of delivery include bombardment and CC transforming, which only allow a fraction of the cell population to be infected and can additionally damage cells as they cause physical opening CC of the cell walls/membranes to allow entry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
